The Effects of Test-Optional Admissions on Underrepresented Minority Enrollment and Graduation

Abstract: A growing number of colleges and universities have made the submission of college entrance exam scores optional for undergraduate admissions to bolster racial diversity. This study uses institutional panel data from IPEDS and applies a two-way fixed effects approach to determine whether the policy is effective at achieving this goal. It also estimates the impact of the policy on the graduation rates for underrepresented minority (URM) students. It finds that the policy has a small but positive effect on the fraction of first-time students enrolling at liberal arts colleges that are of a URM background. The effects of this policy on URM 4-year and 6-year graduation rates are heterogeneous across colleges by their selectivity in admissions, where relatively less selective colleges experience declines in these graduation rates. Finally, this study finds some evidence that the URM enrollment effects are initially muted at colleges adopting the policy relatively early in the panel, but these effects grow over time.

When is Discrimination Unfair? (with Peter Kuhn) – NBER Working Paper 30236

Abstract: Using a vignette-based survey experiment on Amazon's Mechanical Turk, we measure how people's assessments of the fairness of race-based hiring decisions vary with the motivation and circumstances surrounding the discriminatory act and the races of the parties involved. Regardless of their political

leaning, our subjects do not distinguish between taste-based and statistical discrimination, but they react in very similar ways to other aspects of the act, such as the quality of information on which statistical discrimination is based. Compared to conservatives, moderates and liberals are much less accepting of discriminatory actions, and consider the discriminatee's race when making their fairness assessments. We describe four simple models of fairness – utilitarianism, race-blind rules (RBRs), racial in-group bias, and belief-based utilitarianism (BBU) – and show that the latter two are inconsistent with major patterns in our data. Instead, we argue that a two-group model in which conservatives care only about race-blind rules (RBRs), while moderates and liberals care about both RBRs and utilitarian ethics can account for the main patterns we see.
